

I claim:

1. A container structure comprising: a cover base adapted to be assembled to a container body and having a dispensing orifice surrounded by a collar which acts as a first seal, said cover base including a lip adjacent the lower end of said collar normally projecting into said orifice and resiliently deforming about a closure plug to act as a second seal; a cap including a closure plug for fitted assembly in said collar; and said cover base further including a downwardly opening peripheral channel and projecting flexible rib means in the bottom of said channel for sealing against the top edge of a container body.

2. A container structure according to claim 1 wherein said cover base further includes a bead on one sidewall of said channel for locking said top edge snugly against said rib means.

3. A container structure comprising: a cover base adapted to be assembled to a container body and having a dispensing orifice surrounded by a collar which acts as a first seal, said cover base including a lip adjacent the lower end of said collar normally projecting into said orifice and resiliently deforming about a closure plug to act as a second seal; a cap including a

closure plug for fitted assembly in said collar; and a flexible strap hingedly connecting said cap to said cover base adjacent one edge and wherein said cap and cover base have confronting beads adjacent the opposite edge, forcing of said cap bead passed said cover base bead latching said cap on said cover base.

4. A container structure according to claim 3 wherein said cover base further includes a downwardly opening peripheral channel and a bead on one sidewall of said channel and wherein said channel bead and said base bead project in a laterally outward direction.

5. A container structure comprising: a cover base adapted to be assembled to a container body and having a dispensing orifice surrounded by a collar which acts as a first seal, said cover base including a lip adjacent the lower end of said collar normally projecting into said orifice and resiliently deforming about a closure plug to act as a second seal; a cap including a closure plug for fitted assembly in said collar; and said cover base and said cap have cooperating pairs of vertically offset lineal beads.
